

the restaurant

AI phone assistant — the accounts to open
A step-by-step guide. Prepared 12 August 2026.

What this is

The assistant needs six services to run. This guide walks you through opening each one, in order, with what to click on every screen.

You open all six in the restaurant’s name, on the restaurant’s card. Each company bills you directly. Nothing passes through me, and there is no markup on any of it. If you ever want to stop, you close the accounts yourself — you do not need my permission, and you do not need to ask me for your data.

Total running cost is about **\$20 CAD per month**, against the **\$275** you pay today.

BEFORE YOU START
Set aside about **one hour**. Have ready: the restaurant’s **credit card**, the legal business name and address (**1234-5678 Quebec Inc., 123 Example Street**), and an email address you want the bills to go to. Use the **same email for all six** — it makes them far easier to keep track of.

The six accounts

#	Service	What it does	Cost / month	Card?
1	LiveKit	Connects phone calls to the assistant	Free	No
2	Fly.io	The server the assistant runs on	\$9.80	Yes
3	Twilio	Your new 514 phone number	\$2.90	Yes
4	Google AI	Understands what the caller wants	\$1.50	Yes
5	Deepgram	Hears and understands speech	\$1.20	No
6	Supabase	Stores your call records, in Canada	Free	No

Libro is not on this list. It stays exactly as it is — same account, same login, same bill. The assistant books into the Libro you already have.

DO THEM IN THIS ORDER
LiveKit must be first and Twilio must come after it, because Twilio needs an address that LiveKit gives you. The other four can be done in any order.

Opening the accounts

Each step below is one screen. Where it says **send me**, copy the value somewhere safe — the last page explains how to get them all to me at once.

1 LiveKit

Connects a phone call to the assistant. Do this one first.

Free

No card needed

1. Go to **cloud.livekit.io** and choose **Sign up**.
2. Sign up with the restaurant email.
3. When it asks for a project name, type **resto-voice** and create it.
4. In the left sidebar, click **Settings**, then **API Keys**.
5. Click **Create key**. Name it **resto-agent**.
6. It shows you three values: a **URL** (starts with `wss://`), an **API Key**, and an **API Secret**. **Send me all three**.

The secret is shown **once only**. Copy it before you close that box. If you lose it, no harm done — delete the key and make a new one.

2 Fly.io

The server that runs the assistant, 24 hours a day, in Toronto.

\$9.80

Card needed

1. Go to **fly.io** and choose **Sign up**.
2. Sign up with the restaurant email.
3. Open **Billing** and add the restaurant credit card. Fly will not run anything until a card is on file.
4. Go to your organisation, then **Members**, then **Invite**.
5. Invite **a.naim2004@gmail.com**. That lets me deploy and fix the assistant. **You can remove me with one click, at any time.**

This is the one real bill. It is a computer that never sleeps, because a sleeping one means a phone that rings and rings. Roughly the price of a coffee a week.

3 Twilio

The new 514 phone number the assistant answers.

\$2.90

Card needed

1. Go to **twilio.com** and choose **Sign up**. Do LiveKit first.
2. Sign up with the restaurant email and verify your mobile number.
3. Add the restaurant credit card, then add about **\$20** of credit.
4. In the search bar type **Buy a number**. Choose **Canada**, then area code **514** (or **438**), and make sure **Voice** is ticked. Buy it — about \$1.15 per month.
5. **Write the new number down and send it to me.**
6. Click **Console** at the top left to go back to the main page. Near the bottom you will see **Account SID** and **Auth Token** (click **Show** to reveal the token). **Send me both.**

Your existing number, 514-555-0100, is not touched. It keeps ringing in the restaurant exactly as it does today. The assistant answers a brand-new number, so you can test it for as long as you like before telling a single customer about it.

4 Google AI

The part that works out what the caller is asking for.

\$1.50

Card needed

1. Go to **aistudio.google.com/apikey**.
2. Sign in with the restaurant's Google account.
3. Click **Create API key**, then **Create API key in new project**.
4. Copy the key and **send it to me**.
5. Click **Set up billing** on that same page and add the restaurant card. This step is not optional — see the note.

The free version must not be used for a real phone line. It is capped, and when the cap is hit calls simply fail — on a busy Friday night, silently. Adding the card lifts the cap. Your actual usage is about **\$1.50 a month**.

5 Deepgram

The ears. Turns what the caller says into words.

\$1.20

No card needed

1. Go to **console.deepgram.com/signup**.
2. Sign up with the restaurant email.
3. In the left sidebar click **API Keys**.
4. Click **Create a New API Key**, name it **resto-agent**, leave the permission as **Member**, and create it.
5. Copy the key and **send it to me**. It is shown once only.

Deepgram gives **\$200 of free credit** with no card. At your call volume that is several years. You will not pay anything here for a very long time.

6 Supabase

Keeps a record of every call, so you can check what happened.

Free

No card needed

1. Go to **supabase.com/dashboard** and sign up with the restaurant email.
2. Click **New project** and name it **resto-calls**.
3. **For Region, choose “Canada (Central)” — ca-central-1.** Do not accept the default. See the note.
4. Set a database password. Save it somewhere — a password manager, or written down at home.
5. Wait about two minutes for it to finish setting up.
6. Go to **Project Settings**, then **Database**, then **Connection string**, and choose the **URI** tab. **Send me that line.**

The region matters and cannot be changed later. This database holds your guests' names and phone numbers. Quebec's Law 25 governs that information leaving the province, so it stays in Montreal. If you pick the default US region by mistake, tell me — we delete it and start again, which takes five minutes.

Sending me the details

Once the six accounts exist, I need the values below to connect them together. This is a one-time job.

From	What to send
LiveKit	URL, API Key, API Secret
Fly.io	Nothing — just invite a.naim2004@gmail.com as a member
Twilio	Account SID, Auth Token, and the new 514 number
Google AI	The API key
Deepgram	The API key
Supabase	The database connection string (URI)

HOW TO SEND THEM

These values are like keys to the building. **Please do not send them by text message or ordinary email.** Best: hand them to me in person, or use a shared password manager. Otherwise tell me and I will send a one-time secure link. **You can delete and regenerate any of them at any time**, from the same screen you got it from — that is what owning the accounts means.

What you are paying, once it is live

Service	Monthly
Fly.io — the server	\$9.80
Twilio — phone number and minutes	\$2.90
Google AI — understanding callers	\$1.50
Deepgram — speech recognition	\$1.20
The voice the caller hears — billed through LiveKit	\$1.80
LiveKit call handling, and Supabase call records	Free at your volume
Allowance for busier months (15%)	\$2.60
Total	~\$20 / month

Your measured volume: 102 calls and 111 minutes a month, from 84 calls to your line between 30 June and 25 July 2026. Mostly fixed cost, so it barely moves as calls rise.

What you never have to do

No server to look after. No software to update. No backups. Nothing to install on your computer or your phone. Once these six accounts exist, **Libro stays the only system you actually manage** — exactly what you asked for.

If something looks wrong

Each of these companies emails you directly if a payment fails, so you hear about problems before I do. If a bill looks strange, or a screen does not match this guide, send me a photo rather than guessing — these screens change often.
